

UI Bug Report

Paylocity Benefits Dashboard

STE Assessment — Manual Execution Results

11 bugs found · Chromium · May 21, 2026 · Diego Lizarraga

Summary

Environment: <https://wmxrww14uc.execute-api.us-east-1.amazonaws.com/Prod>

Browser: Chromium with DevTools enabled

Total bugs found: 11

ID	Title	Severity	Status
BUG-UI-001	Navbar logo navigates unauthenticated user to dashboard shell	P2 — Medium	Open
BUG-UI-002	First Name and Last Name columns swapped in employee table	P1 — High	Open
BUG-UI-003	Edit Employee modal title displays Add Employee	P2 — Medium	Open
BUG-UI-004	No validation error messages on invalid Add or Edit submission	P1 — High	Open
BUG-UI-005	Table borders overlap content with long names	P3 — Low	Open
BUG-UI-006	favicon.ico returns 403 on every page load	P3 — Low	Open
BUG-UI-007	Login form submits credentials as plain text in network payload	P1 — High	Open
BUG-UI-008	Session expires after short idle or repeated page refresh	P3 — Low	Pending Clarification
BUG-UI-009	Login returns HTTP 405 for wrong username combinations	P1 — High	Open
BUG-UI-010	HTTP 405 renders raw browser error page instead of graceful message	P2 — Medium	Open
BUG-UI-011	Browser back button after logout restores authenticated session	P1 — High	Open

Bug Details

BUG-UI-001

Navbar logo navigates unauthenticated user to dashboard shell

Severity	P2 — Medium
Found in	TC-UI-LOGIN exploratory
Status	Open
URL	https://wmxrwq14uc.execute-api.us-east-1.amazonaws.com/Prod/Account/Login

Steps to Reproduce

- Navigate to the Login page without authenticating.
- Click the 'Paylocity Benefits Dashboard' navbar logo in the top left.
- Observe the page that loads.

Expected

Unauthenticated users are redirected to Login. The Benefits Dashboard never renders without a valid session.

Actual

The Benefits Dashboard loads at /Prod/Benefits. The employee table renders empty with no rows and no 'No employees found' message. The Log Out link is absent. The console shows a 401 error. The page shell renders despite the failed API call with no redirect.

Root Cause

The navbar anchor is a direct link with no authentication guard on the client side. The server renders the page shell without verifying session state, and there's no 401 handler to redirect back to login.

Impact

No employee data is exposed, but an unauthenticated user reaches a page they should never see, thus showing application structure and URL patterns.

BUG-UI-002

First Name and Last Name columns swapped in employee table

Severity	P1 — High
Found in	TC-UI-ADD-001
Status	Open
URL	https://wmxrqw14uc.execute-api.us-east-1.amazonaws.com/Prod/Benefits

Steps to Reproduce

- Log in. Click Add Employee. Enter firstName: "John", lastName: "Doe", dependants: 0. Click Add.
- Observe the employee row in the table.

Expected

Last Name column shows: Doe | First Name column shows: John

Actual

Last Name column shows: John | First Name column shows: Doe

Last Name	First Name
John	Doe

Root Cause

```
// employeeClient.js - loadTable()
row.insertCell().innerHTML = employee.firstName; // index 1 → Last Name column
row.insertCell().innerHTML = employee.lastName;  // index 2 → First Name column
// Table header: <th>Last Name</th> <th>First Name</th>
// Insertion order doesn't match header order
```

Impact

Every employee record shows the wrong name in the wrong column. Affects the core user story: viewing employee benefit data correctly.

BUG-UI-003

Edit Employee modal title displays 'Add Employee'

Severity	P2 — Medium
Found in	TC-UI-EDIT-001
Status	Open
URL	https://wmxrwwq14uc.execute-api.us-east-1.amazonaws.com/Prod/Benefits

Steps to Reproduce

- Log in. Click the Edit (pencil) icon on any employee row.
- Observe the modal title.

Expected

Modal title reads 'Edit Employee' when opened via the Edit action.

Actual

Modal title reads 'Add Employee' regardless of whether opened via Add or Edit.

Root Cause

Static title is never updated by JavaScript

```
<h5 class="modal-title">Add Employee</h5>
// JavaScript toggles buttons but never updates the title text
```

BUG-UI-004

No validation error messages on invalid Add or Edit submission

Severity	P1 — High
Found in	TC-UI-ADD-006 through 010, TC-UI-EDIT-006 through 010
Status	Open
URL	https://wmxrwwq14uc.execute-api.us-east-1.amazonaws.com/Prod/Benefits

Steps to Reproduce

- Log in, Click Add Employee, Leave all fields empty, Click Add.

Expected

Validation error messages appear indicating which fields are required.

Actual

Modal stays open silently. No error message, no field highlighting, no indication of what went wrong. Affects all invalid input scenarios: empty fields, invalid dependants, oversized values.

Root Cause

```
// employeeClient.js - no .fail() handler
.done(function () { done(); });
// When API returns 400, failure is silently ignored
// Missing: .fail(function(xhr) { showValidationError(xhr.responseJSON); });
```

BUG-UI-005

Table borders overlap cell content with long names

Severity	P3 — Low
Found in	TC-UI-ADD-013
Status	Open
URL	https://wmxrqw14uc.execute-api.us-east-1.amazonaws.com/Prod/Benefits

Steps to Reproduce

- Log in. Add employee with a firstName of 50 characters. Observe the table row.

Expected

Table accommodates long values. Cell borders remain aligned with content.

Actual

Table cell expands but borders don't resize. Border lines overlap cell content making the row difficult to read.

BUG-UI-006

Favicon.ico returns 403 Forbidden on every page load

Severity	P3 — Low
Found in	TC-UI-LOGIN-011 console errors check
Status	Open
URL	All pages — DevTools Console

Steps to Reproduce

- Open DevTools Console. Navigate to any page. Observe console output.

Actual

```
/favicon.ico:1 Failed to load resource: the server responded with a status of 403 (Forbidden)
```

Appears on every page load. Server should serve the favicon or return 404, not 403.

BUG-UI-007

Login forms submits credentials as plain text in network payload

Severity	P1 — High
Found in	FLAG-01 — network tab inspection
Status	Open
URL	https://wmxrqw14uc.execute-api.us-east-1.amazonaws.com/Prod/Account/Login

Steps to Reproduce

- Open DevTools Network tab. Enter credentials and log in. Inspect the POST request payload.

Actual

```
Username: <entered_username>
Password: <entered_password>
_RequestVerificationToken: <token>
```

Important issue

HTTPS encrypts data in transit. However credentials are visible in DevTools on shared or compromised machines. The _RequestVerificationToken confirms anti-CSRF protection is in place, which is a positive signal.

BUG-UI-008

Session expires after short idle or repeated page refresh

Severity	P3 — Low
Found in	Exploratory observation
Status	Pending Clarification
URL	https://wmxrqw14uc.execute-api.us-east-1.amazonaws.com/Prod/Benefits

Steps to Reproduce

- Log in. Leave the browser idle for ~2 minutes OR refresh several times. Observe session state.

Assessment

Session expiry after idle time is a security feature. The concern is the short timeout and that page refreshes appear to trigger unexpected logout.
Pending product owner clarification on intended session duration.

BUG-UI-009

Login returns HTTP 405 for wrong username combinations

Severity	P1 — High
Found in	TC-UI-LOGIN-003, TC-UI-LOGIN-004
Status	Open
URL	https://wmxrwq14uc.execute-api.us-east-1.amazonaws.com/Prod/Account/Login

Steps to Reproduce — Combination 1

- Navigate to Login page.
- Enter a valid password with an incorrect or empty username.
- Click Log In.

Steps to Reproduce — Combination 2

- Navigate to Login page.
- Enter wrong username and wrong password.
- Click Log In.

Expected

Login fails with a generic 'Invalid credentials.' message. User stays on the login page and can try again.

Actual

What HTTP 405 Means Here

405 Method Not Allowed means the server received a request using an HTTP method it doesn't support for that endpoint. A login form that submits credentials should always accept POST. Getting 405 suggests the login endpoint is misconfigured or the form submits to the wrong URL for certain credential combinations.

Impact

Login is completely broken for the above credential combinations. The user sees a raw browser error page with no recovery path — a P1 because the core authentication flow is non-functional for valid use cases like a mistyped username.

BUG-UI-010
HTTP 405 renders raw browser error page instead of graceful message

Severity	P2 — Medium
Found in	TC-UI-LOGIN-003, TC-UI-LOGIN-004 (related to BUG-UI-009)
Status	Open
URL	https://wmxrqw14uc.execute-api.us-east-1.amazonaws.com/Prod/Account/Login

Steps to Reproduce

- Trigger BUG-UI-009 (wrong username with valid or wrong password).
- Observe the page rendered.

Expected

Even when a server error occurs, the application handles it gracefully and shows a user-friendly error message within the application UI. The user should never see a raw browser error page.

Actual

The browser renders its own error page, entirely replacing the application UI. The application has no error handler for server-side failures on the login form.

Note

This is a separate bug from BUG-UI-009. BUG-UI-009 is the incorrect 405 status from the server. This bug is the missing error handling in the client. Even if BUG-UI-009 is fixed, robust error handling should be present for any unexpected server response.

BUG-UI-010

Browser back button after logout restores authenticated session data

Severity	P1 — High
Found in	FLAG-02 — session management exploratory
Status	Open
URL	https://wmxrwq14uc.execute-api.us-east-1.amazonaws.com/Prod/Benefits

Steps to Reproduce

- Log in to the Benefits Dashboard with valid credentials.
- Click Log Out.
- Confirm you are redirected to the Login page.
- Click the browser back button.
- Observe the page that loads.

Expected

The back button navigates to Login or redirects there. The session is invalidated server-side on logout. Employee data is not accessible after logout regardless of browser navigation.

Actual

The browser navigates back to the Benefits Dashboard and displays all employee data. The authenticated session is active, the data is still visible, however, the add, edit and delete actions trigger a 401 (Unauthorized) error in console.

Impact

On a shared machine, any person who gains access to the browser after the legitimate user logs out can click the back button and access all employee payroll data. This is a serious session management vulnerability in a payroll application.
